

How is the access management plan good for business?

- Well-managed arterials are often 40 to 50 percent safer than poorly managed routes.
- Safer approaches result from the installation of medians, which can be streetscaped to attract investment and customers.
- Managing access can result in better traffic flow, fewer crashes and a better experience for customers.
- Studies show the vast majority of businesses do as well or better after access management projects are completed.
- Business customers surveyed in three states overwhelmingly supported access management projects because their drive became quicker, safer and easier.
